The great interest of this method lies in the fact that it makes it possible the direct deposition, with good adhesion, of LDHs films on metal substrates with a relative control of film density, thickness and morphology. In addition to an electronic role, metal complexes may also be used to geometrically orient? AnUnderestimatedtypeoffabrics?In particular it has been revealed that its decrement is linked to the dispersion of LDH in the polymer matrix, increasing from intercalated LDHs toward exfoliated ones.
