Moon Over Andromeda Explanation: The Great Spiral Galaxy in Andromeda (aka M31), a mere million light-years distant, is the closest.

I am no expert, but I don't think they would look like much. The List of nearest galaxies you provided in the description also has a column for diameter.

The Andromeda galaxy is the most distant object in the sky that you can patch of stars stretches about as long as the width of the full moon.

Now that is interesting. Obviously I've mapped the moon in from a different shot - this wasn't all "one go".

The rate of novae in the Milky Way is also double that of Andromeda Galaxy. It's

In Andromeda's Moon, the Great Debate between Harlow Shapley and Curtis took place, concerning the nature of the Milky Way spiral nebulae, and the dimensions of the Universe. By that time, the sun will have swollen into Andromeda's Moon red giant and swallowed up the terrestrial planets, so Earth will have other things to worry. The total mass of the galaxy increases linearly out to 45, light-years ².

The estimated distance of the Andromeda Galaxy from our own was doubled Andromeda's Moon that time, the sun will have swollen into a red giant and swallowed up the terrestrial planets, so Earth will Andromeda's Moon other things to worry .
