First, while the response rate was large, there may have been a responder bias. Thus, the aim of the present study was to examine the association between the implementation of discharge planning and length of hospital stay of acute psychiatric inpatient care in Japan. Because the present study focused on the link between inpatient treatment and community-based post-discharge care, patients were divided into the following two groups:

Theseresultssuggestthatbecauseoftherequirementofashorterlengthofstays. Several patient characteristics have been identified as factors related to a longer length of stay in psychiatric inpatient care; such factors include male sex [ 5 – 8 ], schizophrenic and delusional disorders [ 679 ], physical comorbidity [ 8 ], younger age of onset of mental disorder [ 8 ], and less adherence to medication [ 10 ]. Depression and dementia are the two most frequent psychiatric syndromes in the older adult population. Annual Health, Labour and Welfare

Report CornellScaleforDepressioninDementia.Length of stay in psychiatry is suggested to follow a hazard-based distribution [ 28 ].
